

PerfX Studio — network flow

Which machine talks to which, over what, and in what order — from opening the portal to running a load test. Recordings are processed on the tester's own PC; only collections and test plans travel to the server, and they are held in memory only.

The flow, step by step

- 1 Open the portal.** The browser loads PerfX Studio from the IIS server over HTTPS. IIS hands the request to the Node.js app through iisnode.
- 2 Download the recorder (once).** The tester downloads *cdp-recorder.exe* from the portal and runs it locally. Nothing is installed.
- 3 Record the journey.** The recorder opens its own Edge or Chrome window. The tester uses the application under test, naming each step from the floating toolbar. The recorder saves *recording.har* to the local disk.
- 4 Build the script locally.** The HAR is opened in the Recorder or Script Studio, which filter, correlate and produce the script ZIP **inside the browser**. The recording is never uploaded.
- 5 Or convert a collection.** A Postman or Bruno collection, or a JMeter plan, is uploaded. The server parses, analyses and generates the scripts in memory and streams the ZIP back.
- 6 Usage event.** A small record (which tool, when, browser details) goes to the admin dashboard. It never includes file contents.
- 7 Hand off to LoadRunner.** The tester uploads the ZIP to LoadRunner Enterprise or opens it in VuGen.
- 8 Run the load test.** Load generators run many virtual users against the application under test.

Ports and protocols

FROM → TO	PORT / CHANNEL	CARRIES
Browser → IIS	HTTPS 443	portal pages, uploads, ZIP downloads, recorder download
IIS → Node.js	iisnode pipe	same requests, inside the server
Toolbar → recorder	127.0.0.1:8787	start, stop, step names
Recorder → its browser	localhost:9333	DevTools protocol: network events
Browser → app under test	HTTPS	the tester's real journey test
Load generators → app	HTTPS	virtual-user load

Privacy by design: uploads are held only in server memory for the length of one request. Recordings stay on the tester's PC. Password, PIN and CVV fields are redacted before a recording is saved.
